Some *Infinite Energy* readers are surely familiar with the work of Wilhelm Mohorn, inventor of the Aquapol free energy moisture control device. The device, patented in 1996 (European Patent 0688383) but in development since 1985, is an eco-friendly system for eradicating dampness and drying out buildings. The system operates with no batteries or electricity, using instead field energy generated by the earth. The device reverses the polarity of water molecules found in walls and causes the damp to flow downward, leading to dehydration. Mohorn first tested each device as it was built. He could instantly sense the field so could determine if the device was working properly. In the early 1990s, Mohorn found that the prototype systems did not work in some places. He discovered that the earth's energy field sometimes changed polarity so his system would not work. So Mohorn developed a "universal receiving antenna" which uses both right and left polarized fields. It is proven to work on all continents it has been installed. Mohorn says of the device, "The Aquapol system is a totally new physical generator which generates free energy into another form of energy (similar to electromagnetic waves) which influences the movement of moisture in capillary systems like walls. The theory is based on my working hypotheses from 1992."

A summary of Mohorn's theory, originally published in the *New Energy Technologies* journal, is available online at: <http://www.aquapol.co.uk/index.php?go=science/energy>

Mohorn, an Austrian-born inventor and engineer, credits the work of Nikola Tesla as inspiration for development of the Aquapol device. He said, "Tesla is a real example of a genius and visionary."

Aquapol has installed over 50,000 systems since 1985, mostly in Europe but in 26 countries total. Among some of the historic buildings that have used Aquapol successfully are: Hungarian Parliament (Budapest), The Joseph Haydn Museum (Eisenstadt, Austria), Kyalami Castle (Johannesburg, South Africa) and the Greek Oriental Church (Vienna, Austria). The company is now extending installations to North America. Recently, Aquapol began a U.S.-based operation in Clearwater, Florida.

The Hotel Fuchspalast in St. Veit, Austria is one of thousands of satisfied customers who have used the Aquapol device in their business. Rogner International Hotel Development Group, which owns the hotel, used the device after serious water damage. Franz Ulbing said, "The indoor climate has now improved and the basement can be used again. We would always choose Aquapol again, because no

construction work has been necessary." A private customer, Walter Kowald, owns a 16th century home known as Neudeckerhof in Vienna, Austria. He said of the device, "The biggest advantages are obvious. For a large surface area you only need a single device, you do not need a supply of electricity and do not have to make any structural changes. Besides, it is a real wonder, absolute miracle, even though I somehow understand how the device works. It is a definite advantage that a device which looks like a light fixture can have such a decisive result without affecting anything."

The cost of the Aquapol device depends entirely on the extent of the problem and the size of the space. The cost includes an initial damp analysis, with a detailed summary of the eradication plan. Dehydration is begun after installation of the Aquapol device, which must be located in an exact spot depending on the findings in the initial analysis. In addition to requiring no batteries or electricity, the device uses no chemicals and requires no maintenance. The Aquapol device has a 25-year warranty.

Aquapol produced an 18-minute video explaining the process and device. The YouTube video is in two parts, with Part 1 at: http://www.youtube.com/watch?v=7WQJ-0Vwa_Y

Aquapol can be contacted via their U.S. or UK websites and emails:

We spoke with Wilhelm Mohorn about the Aquapol device:

IE: How and when did you first come up with the idea for the Aquapol?

Mohorn: In 1983 when I saw rusty drums in my old basement.

IE: Did you originally think it would be a "free energy" solution?

Mohorn: At the time I postulated a free dynamic geoelectric field from Mother Earth. I was not aware of zero point

energy at that time.

IE: How long did it take to "perfect" it and begin marketing the early units?

Mohorn: For the first series it took two years, and the "perfect" unit I got done after about nine years.

IE: Why did you choose water and moisture problems as the challenge to solve?

Mohorn: Because I myself had the problem of moisture in my old basement.

IE: What has been the biggest challenge in getting Aquapol adopted?

Mohorn: After I found out that the existing electromagnetic theory doesn't fit and creates more problems instead of solutions, in 1990 I had to fully change my operational work and research nearly full-time on the absolute new working hypothesis. Around 1991 or 1992 I solved all the problems with the Aquapol device. This was a race between closing the company because of too many claims (due to longer times for the device to work) or survive with "the truth"—the new

theory—and get it applied into the device.

IE: How has the product improved since 1985?

Mohorn: I have four main generations. After 1992 I got the perfect Aquapol device completed.

IE: When did you start to expand the Aquapol offerings, and enter other markets, like Australia, New Zealand, the United States, etc.?

Mohorn: I started to expand the Aquapol offerings more and more when I developed the wall diagnostic technology and some other accomplishment technologies which you need as a professional Aquapol contributor. The main work got done around 1997. Then I got more focused on expanding the system in other countries.

IE: Have you found any applications where the device did not work properly?

Mohorn: The device only works on rising damp matters and not on about 11 other causes of moisture.

IE: Have you found much resistance to your technology, or the fact that it uses no external energy?

Mohorn: Yes, of course. I get attacked in the media. The most enemies behind the attacks are competitors who are dealing with chemical injection systems which have 20-40% efficiency (stated by a court decision in Germany).

IE: Has there been scientific acceptance of Aquapol technology?

Mohorn: If a scientist really goes into my research material and also documentation material, about 90% accept the working hypotheses from 1992.

IE: What do you tell the skeptical Ph.D. scientist who claims that this is impossible?

Mohorn: I refer them to the well known zero-point energy or quantum field, etc., which is basically known in physics or I use quotes from the 2005 *NASA News*. And the rest is working hypothesis. A big argument is of course that we have 50,000 installations all over the world.

IE: Why has it taken so long to introduce the Aquapol system to the U.S.? We certainly have lots of moisture problems here!

Mohorn: The much bigger market is in Europe. So I was concentrating on the EU. An international movie in 2012 helped us to get it in some other countries out of the EU, like Taiwan and Russia.

IE: Do you have other applications in mind for the Aquapol technology?

Mohorn: Yes, these include: reducing geopathic fields; hydrating or dehydrating soils in agricultural areas.

IE: Is it possible to use the Aquapol receiver unit to put out electrical energy in a form to charge batteries, run LED lights, etc.?

Mohorn: Maybe in the future.

IE: Could this be used for applications like jungle villages where no energy is available, for permanent light (and fan power) by combining Aquapol technology and LED light bulbs?

Mohorn: Maybe.

IE: Are there other areas of “free energy” that your technology might be adapted for (or other newer energy developments in the lab)?

Mohorn: No.

IE: When do you think we will see large scale use of new free energy technologies, like LENR?

Mohorn: When: a) millions of people on this planet get informed of the truth about free energy and see some working prototypes or systems; b) the energy monopoly gets overpowered in many countries; c) the politicians get ethical and help mankind and the planet with this new technology—not pushing commercial energy systems by law, etc.

IE: Who do you think will be the inventor(s) of the new free energy technologies?

Mohorn: All great inventions of history come from single individuals—never from groups! So I think most inventions (prototypes) will come from clever outsiders or people with a technical background like engineers.

IE: What do you think will be the world’s leading source of electrical energy in 2025?

Mohorn: Water, new hydrogen techs (which are using free energy) and maybe 2030-2035 really free energy generators in different ways.

IE: Are there any other things you would like to say to the readers of *Infinite Energy*?

Mohorn: The speed of expansion and acceptance is determined only by our group of free energy fans and workers, producers or researchers. If we spread workable free energy systems (not so much focused on theories) all over the world—producing documentary movies for TV or cinemas or internet etc.—we can accelerate the expansion enormously! A great example in the U.S. is the THRIVE Movement from Foster Gamble. In Europe the “AZK” in Switzerland and all the really active space energy associations. And of course publishing outlets like *Infinite Energy*, etc. But the future in disseminating free energy will be “movies”—especially documentary movies which get into mainstream mediums. □ □
